Recap: $LR(0)$ and $SLR(1)$ Parsing

Computing $LR(0)$ Sets

Theorem (Computing $LR(0)$ sets)

Let $G = \langle N, \Sigma, P, S \rangle \in CFG_{\Sigma}$ be start separated by $S' \rightarrow S$ and reduced.

1. $LR(0)(\varepsilon)$ is the least set such that

- $[S' \rightarrow \cdot S] \in LR(0)(\varepsilon)$ and
- if $[A \rightarrow \cdot B\gamma] \in LR(0)(\varepsilon)$ and $B \rightarrow \beta \in P$,
then $[B \rightarrow \cdot \beta] \in LR(0)(\varepsilon)$.

2. $LR(0)(\alpha Y)$ ($\alpha \in X^*$, $Y \in X$) is the least set such that

- if $[A \rightarrow \gamma_1 \cdot Y\gamma_2] \in LR(0)(\alpha)$,
then $[A \rightarrow \gamma_1 Y \cdot \gamma_2] \in LR(0)(\alpha Y)$ and
- if $[A \rightarrow \gamma_1 \cdot B\gamma_2] \in LR(0)(\alpha Y)$ and $B \rightarrow \beta \in P$,
then $[B \rightarrow \cdot \beta] \in LR(0)(\alpha Y)$.

Recap: $LR(0)$ and $SLR(1)$ Parsing

$LR(0)$ Conflicts

Definition ($LR(0)$ conflicts)

Let $G = \langle N, \Sigma, P, S \rangle \in CFG_{\Sigma}$ and $I \in LR(0)(G)$.

- I has a **shift/reduce conflict** if there exist $A \rightarrow \alpha_1 a \alpha_2, B \rightarrow \beta \in P$ such that

$$[A \rightarrow \alpha_1 \cdot a \alpha_2], [B \rightarrow \beta \cdot] \in I.$$

- I has a **reduce/reduce conflict** if there exist $A \rightarrow \alpha, B \rightarrow \beta \in P$ with $A \neq B$ or $\alpha \neq \beta$ such that

$$[A \rightarrow \alpha \cdot], [B \rightarrow \beta \cdot] \in I.$$

Lemma

$G \in LR(0)$ iff no $I \in LR(0)(G)$ contains conflicting items.

Proof.

omitted □

Recap: $LR(0)$ and $SLR(1)$ Parsing

The goto Function

Observation: if $G \in LR(0)$, then $LR(0)(\gamma)$ yields **deterministic shift/reduce decision** for $NBA(G)$ in a configuration with pushdown γ

\implies **new pushdown alphabet:** $LR(0)(G)$ in place of X

Moreover $LR(0)(\gamma Y)$ is determined by $LR(0)(\gamma)$ and Y but **independent from** γ in the following sense:

$$LR(0)(\gamma) = LR(0)(\gamma') \implies LR(0)(\gamma Y) = LR(0)(\gamma' Y)$$

Definition ($LR(0)$ goto function)

The function **goto** : $LR(0)(G) \times X \rightarrow LR(0)(G)$ is determined by

$$\text{goto}(I, Y) = I' \quad \text{iff} \quad \text{there exists } \gamma \in X^* \text{ such that} \\ I = LR(0)(\gamma) \text{ and } I' = LR(0)(\gamma Y).$$

Recap: $LR(0)$ and $SLR(1)$ Parsing

The $LR(0)$ Action Function

The parsing automaton will be defined using another table, the **action function**, which determines the shift/reduce decision (reminder: $\pi_0 = S' \rightarrow S$).

Definition ($LR(0)$ action function)

The **$LR(0)$ action function** $\text{act} : LR(0)(G) \rightarrow \{\text{red } i \mid i \in [p]\} \cup \{\text{shift, accept, error}\}$ is defined by

$$\text{act}(I) := \begin{cases} \text{red } i & \text{if } i \neq 0, \pi_i = A \rightarrow \alpha \text{ and } [A \rightarrow \alpha \cdot] \in I \\ \text{shift} & \text{if } [A \rightarrow \alpha_1 \cdot a\alpha_2] \in I \\ \text{accept} & \text{if } [S' \rightarrow S \cdot] \in I \\ \text{error} & \text{if } I = \emptyset \end{cases}$$

Corollary

For every $G \in CFG_{\Sigma}$, $G \in LR(0)$ iff act is well defined.

Together, act and goto form the **$LR(0)$ parsing table** of G .

Recap: $LR(0)$ and $SLR(1)$ Parsing

The $LR(0)$ Parsing Automaton I

Definition ($LR(0)$ parsing automaton)

Let $G = \langle N, \Sigma, P, S \rangle \in LR(0)$. The (deterministic) $LR(0)$ parsing automaton of G is defined by the following components:

- Input alphabet Σ
- Pushdown alphabet $\Gamma := LR(0)(G)$
- Output alphabet $\Delta := [\rho] \cup \{0, \text{error}\}$
- Configurations $\Sigma^* \times \Gamma^* \times \Delta^*$
- Initial configuration (w, l_0, ε) where $l_0 := LR(0)(\varepsilon)$
- Final configurations $\{\varepsilon\} \times \{\varepsilon\} \times \Delta^*$
- Transitions:

shift: $(aw, \alpha l, z) \vdash (w, \alpha l', z)$ if $\text{act}(l) = \text{shift}$ and $\text{goto}(l, a) = l'$
reduce: $(w, \alpha l l_1 \dots l_n, z) \vdash (w, \alpha l', z i)$ if $\text{act}(l_n) = \text{red } i$, $\pi_i = A \rightarrow Y_1 \dots Y_n$, $\text{goto}(l, A) = l'$
accept: $(\varepsilon, l_0 l, z) \vdash (\varepsilon, \varepsilon, z 0)$ if $\text{act}(l) = \text{accept}$
error: $(w, \alpha l, z) \vdash (\varepsilon, \varepsilon, z \text{error})$ if $\text{act}(l) = \text{error}$

Recap: $LR(0)$ and $SLR(1)$ Parsing

The $SLR(1)$ Action Function

Definition ($SLR(1)$ action function)

The $SLR(1)$ action function

$$\text{act} : LR(0)(G) \times \Sigma_\varepsilon \rightarrow \{\text{red } i \mid i \in [p]\} \cup \{\text{shift, accept, error}\}$$

is defined by

$$\text{act}(I, \mathbf{x}) := \begin{cases} \text{red } i & \text{if } i \neq 0, \pi_i = A \rightarrow \alpha, [A \rightarrow \alpha \cdot] \in I, \text{ and } \mathbf{x} \in \text{fo}(A) \\ \text{shift} & \text{if } [A \rightarrow \alpha_1 \cdot \mathbf{x} \alpha_2] \in I \text{ and } \mathbf{x} \in \Sigma \\ \text{accept} & \text{if } [S' \rightarrow S \cdot] \in I \text{ and } \mathbf{x} = \varepsilon \\ \text{error} & \text{otherwise} \end{cases}$$

Definition ($SLR(1)$ grammar)

A grammar $G \in CFG_\Sigma$ has the $SLR(1)$ property (notation: $G \in SLR(1)$) if its $SLR(1)$ action function is well defined.

act and the $LR(0)$ goto function (Definition 9.1) form the $SLR(1)$ parsing table of G .

Recap: $LR(0)$ and $SLR(1)$ Parsing

The $SLR(1)$ Parsing Automaton

Definition ($SLR(1)$ parsing automaton)

The **$SLR(1)$ parsing automaton** is defined as in the $LR(0)$ case (see Definition 9.6), except for the **transition relation**:

shift: $(aw, \alpha l, z) \vdash (w, \alpha l', z)$ if $\text{act}(l, a) = \text{shift}$ and $\text{goto}(l, a) = l'$

reduce_a: $(aw, \alpha ll_1 \dots l_n, z) \vdash (aw, \alpha l', zi)$ if $\text{act}(l_n, a) = \text{red } i$, $\pi_i = A \rightarrow Y_1 \dots Y_n$, and $\text{goto}(l, A) = l'$

reduce _{ϵ} : $(\epsilon, \alpha ll_1 \dots l_n, z) \vdash (\epsilon, \alpha l', zi)$ if $\text{act}(l_n, \epsilon) = \text{red } i$, $\pi_i = A \rightarrow Y_1 \dots Y_n$, and $\text{goto}(l, A) = l'$

accept: $(\epsilon, l_0 l, z) \vdash (\epsilon, \epsilon, z 0)$ if $\text{act}(l, \epsilon) = \text{accept}$

error_a: $(aw, \alpha l, z) \vdash (\epsilon, \epsilon, z \text{error})$ if $\text{act}(l, a) = \text{error}$

error _{ϵ} : $(\epsilon, \alpha l, z) \vdash (\epsilon, \epsilon, z \text{error})$ if $\text{act}(l, \epsilon) = \text{error}$

LR(1) Parsing

LR(1) Items and Sets I

Observation: not every element of $\text{fo}(A)$ can follow every occurrence of A
 \implies refinement of $LR(0)$ items by **adding possible lookahead symbols**

Definition 10.1 ($LR(1)$ items and sets)

Let $G = \langle N, \Sigma, P, S \rangle \in \text{CFG}_\Sigma$ be start separated by $S' \rightarrow S$.

- If $S' \Rightarrow_r^* \alpha A a w \Rightarrow_r \alpha \beta_1 \beta_2 a w$, then $[A \rightarrow \beta_1 \cdot \beta_2, a]$ is called an **LR(1) item** for $\alpha \beta_1$.
- If $S' \Rightarrow_r^* \alpha A \Rightarrow_r \alpha \beta_1 \beta_2$, then $[A \rightarrow \beta_1 \cdot \beta_2, \varepsilon]$ is called an **LR(1) item** for $\alpha \beta_1$.
- Given $\gamma \in X^*$, $LR(1)(\gamma)$ denotes the set of all **LR(1) items** for γ , called the **LR(1) set** (or: **LR(1) information**) of γ .
- $LR(1)(G) := \{LR(1)(\gamma) \mid \gamma \in X^*\}$.

LR(1) Items and Sets II

Corollary 10.2

1. For every $\gamma \in X^*$, $LR(1)(\gamma)$ is finite.
2. $LR(1)(G)$ is finite.
3. For every $\gamma \in X^*$, $LR(1)(\gamma)$ “contains” $LR(0)(\gamma)$, i.e.,

$$\{[A \rightarrow \beta_1 \cdot \beta_2] \mid [A \rightarrow \beta_1 \cdot \beta_2, x] \in LR(1)(\gamma)\} = LR(0)(\gamma).$$

4. $[A \rightarrow \beta_1 \cdot \beta_2, x] \in I \in LR(1)(G) \implies x \in \text{fo}(A)$

LR(1) Parsing

LR(1) Conflicts

Definition 10.3 (LR(1) conflicts)

Let $G = \langle N, \Sigma, P, S \rangle \in CFG_{\Sigma}$ and $I \in LR(1)(G)$.

- I has a **shift/reduce conflict** if there exist $A \rightarrow \alpha_1 a \alpha_2$, $B \rightarrow \beta \in P$ and $x \in \Sigma_{\epsilon}$ such that

$$[A \rightarrow \alpha_1 \cdot a \alpha_2, x], [B \rightarrow \beta \cdot, a] \in I.$$

- I has a **reduce/reduce conflict** if there exist $x \in \Sigma_{\epsilon}$ and $A \rightarrow \alpha$, $B \rightarrow \beta \in P$ with $A \neq B$ or $\alpha \neq \beta$ such that

$$[A \rightarrow \alpha \cdot, x], [B \rightarrow \beta \cdot, x] \in I.$$

Lemma 10.4

$G \in LR(1)$ iff no $I \in LR(1)(G)$ contains conflicting items.

Computing LR(1) Sets I

The computation of LR(0) sets (cf. Theorem 8.15) can be extended to cover right contexts:

Theorem 10.5 (Computing LR(1) sets)

Let $G = \langle N, \Sigma, P, S \rangle \in CFG_{\Sigma}$ be start separated by $S' \rightarrow S$ and reduced.

1. $LR(1)(\varepsilon)$ is the least set such that

– $[S' \rightarrow \cdot S, \varepsilon] \in LR(1)(\varepsilon)$ and

– if $[A \rightarrow \cdot B\gamma, \mathbf{x}] \in LR(1)(\varepsilon)$, $B \rightarrow \beta \in P$, and $\mathbf{y} \in \text{fi}(\gamma\mathbf{x})$, then $[B \rightarrow \cdot\beta, \mathbf{y}] \in LR(1)(\varepsilon)$.

2. $LR(1)(\alpha Y)$ ($\alpha \in X^*$, $Y \in X$) is the least set such that

– if $[A \rightarrow \gamma_1 \cdot Y\gamma_2, \mathbf{x}] \in LR(1)(\alpha)$, then $[A \rightarrow \gamma_1 Y \cdot \gamma_2, \mathbf{x}] \in LR(1)(\alpha Y)$ and

– if $[A \rightarrow \gamma_1 \cdot B\gamma_2, \mathbf{x}] \in LR(1)(\alpha Y)$, $B \rightarrow \beta \in P$, and $\mathbf{y} \in \text{fi}(\gamma_2\mathbf{x})$, then $[B \rightarrow \cdot\beta, \mathbf{y}] \in LR(1)(\alpha Y)$.

LR(1) Parsing

Computing LR(1) Sets II

Example 10.6 (cf. Example 9.15)

$LR(1)(G_{LR})$ for $G_{LR} : S' \rightarrow S \quad S \rightarrow L=R \mid R \quad L \rightarrow *R \mid a \quad R \rightarrow L$

$[S' \rightarrow \cdot S, \varepsilon] \in LR(1)(\varepsilon) \quad [A \rightarrow \cdot B\gamma, x] \in LR(1)(\varepsilon), B \rightarrow \beta \in P, y \in \text{fi}(\gamma x) \implies [B \rightarrow \cdot \beta, y] \in LR(1)(\varepsilon) \quad [A \rightarrow \gamma_1 \cdot Y\gamma_2$

$I'_0 := LR(1)(\varepsilon) :$

$[S' \rightarrow \cdot S, \varepsilon]$	$[S \rightarrow \cdot L=R, \varepsilon]$	$[S \rightarrow \cdot R, \varepsilon]$	$[L \rightarrow \cdot *R, \varepsilon]$
$[L \rightarrow \cdot a, \varepsilon]$	$[R \rightarrow \cdot L, \varepsilon]$	$[L \rightarrow \cdot *R, \varepsilon]$	$[L \rightarrow \cdot a, \varepsilon]$

$I'_1 := LR(1)(S) :$

$[S' \rightarrow S \cdot, \varepsilon]$

$I'_2 := LR(1)(L) :$

$[S \rightarrow L \cdot =R, \varepsilon]$	$[R \rightarrow L \cdot, \varepsilon]$
---	--

$I'_3 := LR(1)(R) :$

$[S \rightarrow R \cdot, \varepsilon]$
--

$I'_4 := LR(1)(*) :$

$[L \rightarrow * \cdot R, \varepsilon]$	$[L \rightarrow * \cdot R, \varepsilon]$	$[R \rightarrow \cdot L, \varepsilon]$	$[R \rightarrow \cdot L, \varepsilon]$
$[L \rightarrow \cdot *R, \varepsilon]$	$[L \rightarrow \cdot a, \varepsilon]$	$[L \rightarrow \cdot *R, \varepsilon]$	$[L \rightarrow \cdot a, \varepsilon]$

$I'_5 := LR(1)(a) :$

$[L \rightarrow a \cdot, \varepsilon]$	$[L \rightarrow a \cdot, \varepsilon]$
--	--

$I'_6 := LR(1)(L=) :$

$[S \rightarrow L= \cdot R, \varepsilon]$	$[R \rightarrow \cdot L, \varepsilon]$	$[L \rightarrow \cdot *R, \varepsilon]$	$[L \rightarrow \cdot a, \varepsilon]$
---	--	---	--

$I'_7 := LR(1)(*R) :$

$[L \rightarrow *R \cdot, \varepsilon]$	$[L \rightarrow *R \cdot, \varepsilon]$
---	---

$I'_8 := LR(1)(*L) :$

$[R \rightarrow L \cdot, \varepsilon]$	$[R \rightarrow L \cdot, \varepsilon]$
--	--

$I'_9 := LR(1)(L=R) :$

$[S \rightarrow L=R \cdot, \varepsilon]$
--

$I'_{10} := LR(1)(L=L) :$

$[R \rightarrow L \cdot, \varepsilon]$
--

$I'_{11} := LR(1)(L=*) :$

$[L \rightarrow * \cdot R, \varepsilon]$	$[R \rightarrow \cdot L, \varepsilon]$	$[L \rightarrow \cdot *R, \varepsilon]$	$[L \rightarrow \cdot a, \varepsilon]$
--	--	---	--

$I'_{12} := LR(1)(L=a) :$

$[L \rightarrow a \cdot, \varepsilon]$
--

$I'_{13} := LR(1)(L=*R) :$

$[L \rightarrow *R \cdot, \varepsilon]$

$I'_{14} := \emptyset$

In I'_2 : shift on =/reduce on $\varepsilon \implies G_{LR} \in LR(1)$

The LR(1) Action Function

Definition 10.7 (LR(1) action function)

The LR(1) action function

$$\text{act} : LR(1)(G) \times \Sigma_\varepsilon \rightarrow \{\text{red } i \mid i \in [p]\} \cup \{\text{shift, accept, error}\}$$

is defined by

$$\text{act}(I, x) := \begin{cases} \text{red } i & \text{if } i \neq 0, \pi_i = A \rightarrow \alpha \text{ and } [A \rightarrow \alpha \cdot, x] \in I \\ \text{shift} & \text{if } [A \rightarrow \alpha_1 \cdot x \alpha_2, y] \in I \text{ and } x \in \Sigma \\ \text{accept} & \text{if } [S' \rightarrow S \cdot, \varepsilon] \in I \text{ and } x = \varepsilon \\ \text{error} & \text{otherwise} \end{cases}$$

Corollary 10.8

For every $G \in CFG_\Sigma$, $G \in LR(1)$ iff its LR(1) action function is well defined.

The LR(1) goto Function

The goto function is defined in analogy to the LR(0) case (Definition 9.1).

Definition 10.9 (LR(1) goto function)

The function $\text{goto} : LR(1)(G) \times X \rightarrow LR(1)(G)$ is determined by

$$\text{goto}(I, Y) = I' \quad \text{iff} \quad \text{there exists } \gamma \in X^* \text{ such that} \\ I = LR(1)(\gamma) \text{ and } I' = LR(1)(\gamma Y).$$

Again, act and goto form the LR(1) parsing table of G .

LR(1) Parsing

The LR(1) Parsing Table

Example 10.10 (cf. Example 10.6)

$I'_0 := LR(1)(\epsilon) :$	$[S' \rightarrow \cdot S, \epsilon]$	$[S \rightarrow \cdot L=R, \epsilon]$	$[S \rightarrow \cdot R, \epsilon]$	$[L \rightarrow \cdot *R, =]$
$I'_1 := LR(1)(S) :$	$[S' \rightarrow S \cdot, \epsilon]$			
$I'_2 := LR(1)(L) :$	$[S \rightarrow L \cdot =R, \epsilon]$	$[R \rightarrow L \cdot, \epsilon]$		
$I'_3 := LR(1)(R) :$	$[S \rightarrow R \cdot, \epsilon]$			
$I'_4 := LR(1)(*) :$	$[L \rightarrow * \cdot R, =]$	$[L \rightarrow * \cdot R, \epsilon]$	$[R \rightarrow \cdot L, =]$	$[R \rightarrow \cdot L, \epsilon]$
$I'_5 := LR(1)(a) :$	$[L \rightarrow a \cdot, =]$	$[L \rightarrow a \cdot, \epsilon]$		
$I'_6 := LR(1)(L=) :$	$[S \rightarrow L= \cdot R, \epsilon]$	$[R \rightarrow \cdot L, \epsilon]$	$[L \rightarrow \cdot *R, \epsilon]$	$[L \rightarrow \cdot a, \epsilon]$
$I'_7 := LR(1)(*R) :$	$[L \rightarrow *R \cdot, =]$	$[L \rightarrow *R \cdot, \epsilon]$		
$I'_8 := LR(1)(*L) :$	$[R \rightarrow L \cdot, =]$	$[R \rightarrow L \cdot, \epsilon]$		
$I'_9 := LR(1)(L=R) :$	$[S \rightarrow L=R \cdot, \epsilon]$			
$I'_{10} := LR(1)(L=L) :$	$[R \rightarrow L \cdot, \epsilon]$			
$I'_{11} := LR(1)(L=*) :$	$[L \rightarrow * \cdot R, \epsilon]$	$[R \rightarrow \cdot L, \epsilon]$	$[L \rightarrow \cdot *R, \epsilon]$	$[L \rightarrow \cdot a, \epsilon]$
$I'_{12} := LR(1)(L=a) :$	$[L \rightarrow a \cdot, \epsilon]$			
$I'_{13} := LR(1)(L=*R) :$	$[L \rightarrow *R \cdot, \epsilon]$			
$I'_{14} := \emptyset$

(empty = error/ \emptyset)

The LR(1) Parsing Automaton I

Definition 10.11 (LR(1) parsing automaton)

The **LR(1) parsing automaton** is defined as in the **LR(0)** case (see Definition 9.6), except for the **transition relation**:

shift: $(aw, \alpha l, z) \vdash (w, \alpha l', z)$ if $\text{act}(l, a) = \text{shift}$ and $\text{goto}(l, a) = l'$

reduce_a: $(aw, \alpha ll_1 \dots l_n, z) \vdash (aw, \alpha l', zi)$ if $\text{act}(l_n, a) = \text{red } i$, $\pi_i = A \rightarrow Y_1 \dots Y_n$, and $\text{goto}(l, A) = l'$

reduce_ε: $(\varepsilon, \alpha ll_1 \dots l_n, z) \vdash (\varepsilon, \alpha l', zi)$ if $\text{act}(l_n, \varepsilon) = \text{red } i$, $\pi_i = A \rightarrow Y_1 \dots Y_n$, and $\text{goto}(l, A) = l'$

accept: $(\varepsilon, l_0 l, z) \vdash (\varepsilon, \varepsilon, z 0)$ if $\text{act}(l, \varepsilon) = \text{accept}$

error_a: $(aw, \alpha l, z) \vdash (\varepsilon, \varepsilon, z \text{error})$ if $\text{act}(l, a) = \text{error}$

error_ε: $(\varepsilon, \alpha l, z) \vdash (\varepsilon, \varepsilon, z \text{error})$ if $\text{act}(l, \varepsilon) = \text{error}$

LR(1) Parsing

The LR(1) Parsing Automaton II

Example 10.12 (cf. Example 10.6)

$G_{LR} : S' \rightarrow S (0) \quad S \rightarrow L=R \mid R (1, 2) \quad L \rightarrow *R \mid a (3, 4) \quad R \rightarrow L (5)$

$LR(1)(G_{LR})$	act				goto					
	*	=	a	ϵ	S	L	R	*	=	a
I'_0	shift		shift		I'_1	I'_2	I'_3	I'_4	I'_5	
I'_1				accept						
I'_2		shift		red 5					I'_6	
I'_3				red 2						
I'_4	shift		shift		I'_8	I'_7	I'_4	I'_5		
I'_5		red 4		red 4						
I'_6	shift		shift		I'_{10}	I'_9	I'_{11}	I'_{12}		
I'_7		red 3		red 3						
I'_8		red 5								
I'_9				red 1						
I'_{10}				red 5						
I'_{11}	shift		shift		I'_{10}	I'_{13}	I'_{11}	I'_{12}		
I'_{12}				red 4						
I'_{13}				red 3						

(empty = error/ \emptyset)

LR(1) parsing of $a=*a$:

($a=*a, I'_0, \epsilon$)
 $\vdash (=*a, I'_0 I'_5, \epsilon)$
 $\vdash (=*a, I'_0 I'_2, 4)$
 $\vdash (*a, I'_0 I'_2 I'_6, 4)$
 $\vdash (a, I'_0 I'_2 I'_6 I'_{11}, 4)$
 $\vdash (\epsilon, I'_0 I'_2 I'_6 I'_{11} I'_{12}, 4)$
 $\vdash (\epsilon, I'_0 I'_2 I'_6 I'_{11} I'_{10}, 44)$
 $\vdash (\epsilon, I'_0 I'_2 I'_6 I'_{11} I'_{13}, 445)$
 $\vdash (\epsilon, I'_0 I'_2 I'_6 I'_{10}, 4453)$
 $\vdash (\epsilon, I'_0 I'_2 I'_6 I'_9, 44535)$
 $\vdash (\epsilon, I'_0 I'_1, 445351)$
 $\vdash (\epsilon, \epsilon, 4453510)$

LALR(1) Parsing

LALR(1) Parsing

- **Motivation:** resolving conflicts using $LR(1)$ too expensive
- Example 9.15/10.6: $|LR(0)(G_{LR})| = 11$, $|LR(1)(G_{LR})| = 15$
- Empirical evaluations:
 - A. Johnstone, E. Scott: *Generalised Reduction Modified LR Parsing for Domain Specific Language Prototyping*, HICSS '02, IEEE, 2002
 - X. Chen, D. Pager: *Full LR(1) Parser Generator Hyacc and Study on the Performance of LR(1) Algorithms*, C3S2E '11, ACM, 2011

Grammar	$ LR(0)(G) $	$ LR(1)(G) $
Pascal	368	1395
Ansi-C	381	1788
C++	1236	9723

LALR(1) Parsing

LR(0) Equivalence

Observation: potential **redundancy by containment** of $LR(0)$ sets in $LR(1)$ sets (cf. Corollary 10.2)

Definition 10.13 ($LR(0)$ equivalence)

Let $lr_0 : LR(1)(G) \rightarrow LR(0)(G)$ be defined by

$$lr_0(I) := \{[A \rightarrow \beta_1 \cdot \beta_2] \mid [A \rightarrow \beta_1 \cdot \beta_2, x] \in I\}.$$

Two sets $I_1, I_2 \in LR(1)(G)$ are called **$LR(0)$ -equivalent** (notation: $I_1 \sim_0 I_2$) if $lr_0(I_1) = lr_0(I_2)$.

LALR(1) Parsing

LALR(1) Sets

Corollary 10.14

For every $G \in CFG_{\Sigma}$, $|LR(1)(G) / \sim_0| = |LR(0)(G)|$.

Idea: merge $LR(0)$ -equivalent $LR(1)$ sets

(maintaining the lookahead information, but possibly introducing conflicts)

Definition 10.15 ($LALR(1)$ sets)

Let $G \in CFG_{\Sigma}$.

- An information $I \in LR(1)(G)$ determines the $LALR(1)$ set

$$\bigcup [I]_{\sim_0} = \bigcup \{I' \in LR(1)(G) \mid I' \sim_0 I\}.$$

- The set of all $LALR(1)$ sets of G is denoted by $LALR(1)(G)$.

Remark: by Corollary 10.14, $|LALR(1)(G)| = |LR(0)(G)|$
(but $LALR(1)$ sets provide additional lookahead information)

LALR(1) Parsing

LALR(1) Parsing

Sketch of LALR(1) Parsing

- LALR(1) action function

$$\text{act} : LALR(1)(G) \times \Sigma_\epsilon \rightarrow \{\text{red } i \mid i \in [p]\} \cup \{\text{shift, accept, error}\}$$

defined in analogy to the LR(1) case (Definition 10.7)

- $G \in CFG_\Sigma$ has the LALR(1) property ($G \in LALR(1)$) if its LALR(1) action function is well defined
- Also LR(1) goto function (Definition 10.9) carries over to the LALR(1) case:

$$\text{goto} : LALR(1)(G) \times X \rightarrow LALR(1)(G)$$

- act and goto form the LALR(1) parsing table
- **But:** merging of LR(1) sets can produce new conflicts
- LALR(1) used by yacc/bison parser generator (later)

Bottom-Up Parsing of Ambiguous Grammars

Ambiguous Grammars

Reminder (Definition 5.5): $G \in CFG_\Sigma$ is called **unambiguous** if every word $w \in L(G)$ has exactly one syntax tree. Otherwise it is called **ambiguous**.

Lemma 10.16

If $G \in CFG_\Sigma$ is ambiguous, then $G \notin \bigcup_{k \in \mathbb{N}} LR(k)$.

Proof.

Assume that there exist $k \in \mathbb{N}$ and $G \in LR(k)$ such that G is ambiguous.

Hence there exists $w \in L(G)$ with different right derivations. Let αAv be the last common sentence of the two derivations (i.e., $\beta \neq \beta'$):

$$S \Rightarrow_r^* \alpha Av \begin{cases} \Rightarrow_r \alpha \beta v \Rightarrow_r^* w \\ \Rightarrow_r \alpha \beta' v \Rightarrow_r^* w \end{cases}$$

But since $\text{first}_k(v) = \text{first}_k(v)$ for every $v \in \Sigma^*$, Definition 8.8 yields $\beta = \beta'$. \downarrow □

However ambiguity is a **natural specification method** which generally avoids involved syntactic constructs.

Bottom-Up Parsing of Ambiguous Grammars

Bottom-Up Parsing of Ambiguous Grammars I

Example 10.17 (Simple arithmetic expressions)

$G : E' \rightarrow E \quad (0) \quad E \rightarrow E+E \mid E*E \mid a \quad (1, 2, 3)$

Precedence: $* > +$ **Associativity:** left (thus: $a+a*a+a := (a+(a*a))+a$)

$LR(0)(G) : I_0 := LR(0)(\varepsilon) : \quad [E' \rightarrow \cdot E] \quad [E \rightarrow \cdot E+E] \quad [E \rightarrow \cdot E*E] \quad [E \rightarrow \cdot a]$

$I_1 := LR(0)(E) : \quad [E' \rightarrow E \cdot] \quad [E \rightarrow E \cdot +E] \quad [E \rightarrow E \cdot *E]$

$I_2 := LR(0)(a) : \quad [E \rightarrow a \cdot]$

$I_3 := LR(0)(E+) : \quad [E \rightarrow E+ \cdot E] \quad [E \rightarrow \cdot E+E] \quad [E \rightarrow \cdot E*E] \quad [E \rightarrow \cdot a]$

$I_4 := LR(0)(E*) : \quad [E \rightarrow E* \cdot E] \quad [E \rightarrow \cdot E+E] \quad [E \rightarrow \cdot E*E] \quad [E \rightarrow \cdot a]$

$I_5 := LR(0)(E+E) : \quad [E \rightarrow E+E \cdot] \quad [E \rightarrow E \cdot +E] \quad [E \rightarrow E \cdot *E]$

$I_6 := LR(0)(E*E) : \quad [E \rightarrow E*E \cdot] \quad [E \rightarrow E \cdot +E] \quad [E \rightarrow E \cdot *E]$

Conflicts: I_1 : $SLR(1)$ -solvable (reduce on ε , shift on $+/*$)

I_5, I_6 : not $SLR(1)$ -solvable ($+, * \in fo(E)$)

Solution: $I_5 : * > + \implies act(I_5, *) := \text{shift}, + \text{ left assoc.} \implies act(I_5, +) := \text{red 1}$

$I_6 : * > + \implies act(I_6, +) := \text{red 2}, * \text{ left assoc.} \implies act(I_6, *) := \text{red 2}$

Bottom-Up Parsing of Ambiguous Grammars

Bottom-Up Parsing of Ambiguous Grammars II

Example 10.18 (“Dangling else”)

$G : S' \rightarrow S \quad S \rightarrow iSeS \mid iS \mid a$

Ambiguity: $iaea := (1) i(iaea)$ (common) or $(2) i(ia)ea$

$LR(0)(G) : I_0 := LR(0)(\varepsilon) : [S' \rightarrow \cdot S] [S \rightarrow \cdot iSeS] [S \rightarrow \cdot iS] [S \rightarrow \cdot a]$
 $I_1 := LR(0)(S) : [S' \rightarrow S \cdot]$
 $I_2 := LR(0)(i) : [S \rightarrow i \cdot SeS] [S \rightarrow i \cdot S] [S \rightarrow \cdot iSeS]$
 $[S \rightarrow \cdot iS] [S \rightarrow \cdot a]$
 $I_3 := LR(0)(a) : [S \rightarrow a \cdot]$
 $I_4 := LR(0)(iS) : [S \rightarrow iS \cdot eS] [S \rightarrow iS \cdot]$
 $I_5 := LR(0)(iSe) : [S \rightarrow iSe \cdot S] [S \rightarrow \cdot iSeS] [S \rightarrow \cdot iS] [S \rightarrow \cdot a]$
 $I_6 := LR(0)(iSeS) : [S \rightarrow iSeS \cdot]$

Conflict in $I_4 : e \in \text{fo}(S) \implies$ not $SLR(1)$ -solvable

Solution (1): $\text{act}(I_4, e) := \text{shift}$

Overview of Grammar Classes

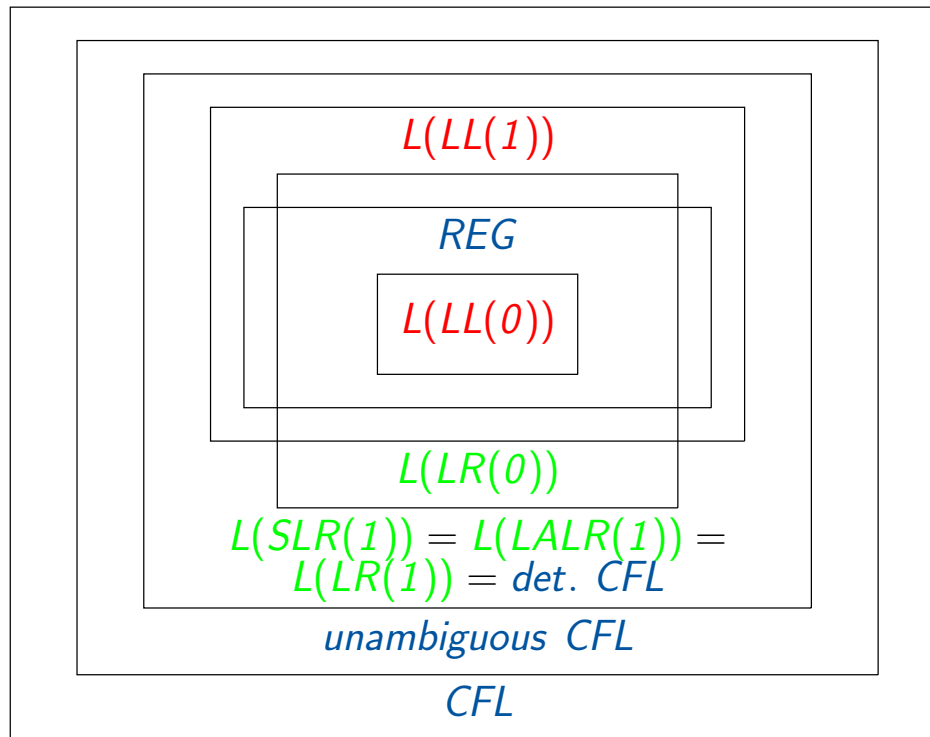

Moreover:

- $LL(k) \subsetneq LL(k+1)$
for every $k \in \mathbb{N}$
- $LR(k) \subsetneq LR(k+1)$
for every $k \in \mathbb{N}$
- $LL(k) \subseteq LR(k)$
for every $k \in \mathbb{N}$

Expressiveness of LL and LR Grammars

Overview of Language Classes

(cf. O. Mayer: *Syntaxanalyse*, BI-Verlag, 1978, p. 409ff)

Moreover:

- $L(LL(k)) \subsetneq L(LL(k+1)) \subsetneq L(LR(1))$
for every $k \in \mathbb{N}$
- $L(LR(k)) = L(LR(1))$
for every $k \geq 1$

Expressiveness of LL and LR Grammars

Why $REG \not\subseteq L(LR(0))$?

Definition 10.19

A language $L \subseteq \Sigma^*$ is called **prefix-free** if $L \cap L \cdot \Sigma^+ = \emptyset$, i.e., if no proper prefix of an element of L is again in L .

Lemma 10.20

$G \in LR(0) \implies L(G)$ prefix-free

Proof.

on the board □

Corollary 10.21

$\{a, aa\} \in REG \setminus L(LR(0))$

Conjecture: $L \in REG \setminus L(LR(0)) \implies L(G)$ not prefix-free?

Expressiveness of LL and LR Grammars

Why $REG \subseteq L(LL(1))$?

Lemma 10.22 (cf. Lecture 2)

Every $L \in REG$ can be recognized by a DFA.

Lemma 10.23

Every DFA can be transformed into an equivalent $LL(1)$ grammar.

Proof.

see Exercise 4.1 □
