Lecture 8: Extensions of CCS: Value Passing and Mobility

Joost-Pieter Katoen and Thomas Noll

Software Modeling and Verification Group

RWTH Aachen University

<http://moves.rwth-aachen.de/teaching/ws-1516/ct/>

Syntax of Value-Passing CCS

Outline of Lecture 8

Syntax of Value-Passing CCS

Semantics of Value-Passing CCS

Translation of Value-Passing into Pure CCS

Modelling Mobile Concurrent Systems

Another Example: Mobile Clients

Syntax of Value-Passing CCS

Value-Passing CCS

- **So far:** pure CCS
 - communication = mere synchronisation
 - no (explicit) exchange of data
- **But:** processes usually **do** pass around data

Syntax of Value-Passing CCS

Value-Passing CCS

- **So far:** pure CCS
 - communication = mere synchronisation
 - no (explicit) exchange of data
- **But:** processes usually **do** pass around data

⇒ Value-passing CCS

- Introduced in Robin Milner: *Communication and Concurrency*, Prentice-Hall, 1989
- Assumption (for simplicity): only **integers** as data type

Syntax of Value-Passing CCS

Value-Passing CCS

- **So far:** pure CCS
 - communication = mere synchronisation
 - no (explicit) exchange of data
- **But:** processes usually **do** pass around data

⇒ Value-passing CCS

- Introduced in Robin Milner: *Communication and Concurrency*, Prentice-Hall, 1989
- Assumption (for simplicity): only **integers** as data type

Example 8.1 (One-place buffer with data (cf. Example 2.5))

One-place buffer that outputs successor of stored value:

$$\begin{aligned} B &= in(x).B'(x) \\ B'(x) &= \overline{out}(x + 1).B \end{aligned}$$

Syntax of Value-Passing CCS

Syntax of Value-Passing CCS I

Definition 8.2 (Syntax of value-passing CCS)

- Let A, \bar{A}, Pid (**ranked**) as in Definition 2.1.

Syntax of Value-Passing CCS

Syntax of Value-Passing CCS I

Definition 8.2 (Syntax of value-passing CCS)

- Let A, \bar{A}, Pid (ranked) as in Definition 2.1.
- Let e and b be integer and Boolean expressions, resp., built from integer variables x, y, \dots

Syntax of Value-Passing CCS

Syntax of Value-Passing CCS I

Definition 8.2 (Syntax of value-passing CCS)

- Let A, \bar{A}, Pid (ranked) as in Definition 2.1.
- Let e and b be integer and Boolean expressions, resp., built from integer variables x, y, \dots
- The set Prc^+ of value-passing process expressions is defined by:

| | |
|--------------------------------|------------------------|
| $P ::= \text{nil}$ | (inaction) |
| $a(x).P$ | (input prefixing) |
| $\bar{a}(e).P$ | (output prefixing) |
| $\tau.P$ | (τ prefixing) |
| $P_1 + P_2$ | (choice) |
| $P_1 \parallel P_2$ | (parallel composition) |
| $P \setminus L$ | (restriction) |
| $P[f]$ | (relabelling) |
| $\text{if } b \text{ then } P$ | (conditional) |
| $C(e_1, \dots, e_n)$ | (process call) |

where $a \in A, L \subseteq A, C \in Pid$ (of rank $n \in \mathbb{N}$), and $f : A \rightarrow A$.

Syntax of Value-Passing CCS II

Definition 8.2 (Syntax of value-passing CCS; continued)

A **value-passing process definition** is an equation system of the form

$$(C_i(x_1, \dots, x_{n_i}) = P_i \mid 1 \leq i \leq k)$$

where

- $k \geq 1$,
- $C_i \in \text{Pid}$ of rank n_i (pairwise distinct),
- $P_i \in \text{Prc}^+$ (with process identifiers from $\{C_1, \dots, C_k\}$), and
- all occurrences of an integer variable y in each P_i are **bound**, i.e., $y \in \{x_1, \dots, x_{n_i}\}$ or y is in the scope of an input prefix of the form $a(y)$ (to ensure well-definedness of values).

Syntax of Value-Passing CCS

Syntax of Value-Passing CCS II

Definition 8.2 (Syntax of value-passing CCS; continued)

A **value-passing process definition** is an equation system of the form

$$(C_i(x_1, \dots, x_{n_i}) = P_i \mid 1 \leq i \leq k)$$

where

- $k \geq 1$,
- $C_i \in \text{Pid}$ of rank n_i (pairwise distinct),
- $P_i \in \text{Prc}^+$ (with process identifiers from $\{C_1, \dots, C_k\}$), and
- all occurrences of an integer variable y in each P_i are **bound**, i.e., $y \in \{x_1, \dots, x_{n_i}\}$ or y is in the scope of an input prefix of the form $a(y)$ (to ensure well-definedness of values).

Example 8.3

1. $C(x) = \bar{a}(x + 1).b(y).C(y)$ is allowed

Syntax of Value-Passing CCS

Syntax of Value-Passing CCS II

Definition 8.2 (Syntax of value-passing CCS; continued)

A **value-passing process definition** is an equation system of the form

$$(C_i(x_1, \dots, x_{n_i}) = P_i \mid 1 \leq i \leq k)$$

where

- $k \geq 1$,
- $C_i \in \text{Pid}$ of rank n_i (pairwise distinct),
- $P_i \in \text{Prc}^+$ (with process identifiers from $\{C_1, \dots, C_k\}$), and
- all occurrences of an integer variable y in each P_i are **bound**, i.e., $y \in \{x_1, \dots, x_{n_i}\}$ or y is in the scope of an input prefix of the form $a(y)$ (to ensure well-definedness of values).

Example 8.3

1. $C(x) = \bar{a}(x + 1).b(y).C(y)$ is allowed
2. $C(x) = \bar{a}(x + 1).\bar{a}(y + 2).\text{nil}$ is disallowed as y is not bound

Semantics of Value-Passing CCS

Outline of Lecture 8

Syntax of Value-Passing CCS

Semantics of Value-Passing CCS

Translation of Value-Passing into Pure CCS

Modelling Mobile Concurrent Systems

Another Example: Mobile Clients

Semantics of Value-Passing CCS

Semantics of Value-Passing CCS I

Definition 8.4 (Semantics of value-passing CCS)

A value-passing process definition $(C_i(x_1, \dots, x_{n_i}) = P_i \mid 1 \leq i \leq k)$ determines the LTS $(Prc^+, Act, \longrightarrow)$ with $Act := (A \cup \bar{A}) \times \mathbb{Z} \cup \{\tau\}$ whose transitions can be inferred from the following rules ($P, P', Q, Q' \in Prc^+$, $a \in A$, x_i integer variables, e_i/b integer/Boolean expressions, $z \in \mathbb{Z}$, $\alpha \in Act$, $\lambda \in (A \cup \bar{A}) \times \mathbb{Z}$):

$$\text{(In)} \frac{}{a(x).P \xrightarrow{a(z)} P[z/x]}$$

$$\text{(Out)} \frac{(z \text{ value of } e)}{\bar{a}(e).P \xrightarrow{\bar{a}(z)} P}$$

$$\text{(Tau)} \frac{}{\tau.P \xrightarrow{\tau} P}$$

$$\text{(Sum}_1\text{)} \frac{P \xrightarrow{\alpha} P'}{P + Q \xrightarrow{\alpha} P'}$$

$$\text{(Sum}_2\text{)} \frac{Q \xrightarrow{\alpha} Q'}{P + Q \xrightarrow{\alpha} Q'}$$

$$\text{(Par}_1\text{)} \frac{P \xrightarrow{\alpha} P'}{P \parallel Q \xrightarrow{\alpha} P' \parallel Q}$$

$$\text{(Par}_2\text{)} \frac{Q \xrightarrow{\alpha} Q'}{P \parallel Q \xrightarrow{\alpha} P \parallel Q'}$$

$$\text{(Com)} \frac{P \xrightarrow{\lambda} P' \quad Q \xrightarrow{\bar{\lambda}} Q'}{P \parallel Q \xrightarrow{\tau} P' \parallel Q'}$$

Semantics of Value-Passing CCS

Semantics of Value-Passing CCS II

Definition 8.4 (Semantics of value-passing CCS; continued)

$$\text{(Rel)} \frac{P \xrightarrow{\alpha} P'}{P[f] \xrightarrow{f(\alpha)} P'[f]}$$

$$\text{(Res)} \frac{P \xrightarrow{\alpha} P' \quad (\alpha \notin (L \cup \bar{L}) \times \mathbb{Z})}{P \setminus L \xrightarrow{\alpha} P' \setminus L}$$

$$\text{(If)} \frac{P \xrightarrow{\alpha} P' \quad (b \text{ true})}{\text{if } b \text{ then } P \xrightarrow{\alpha} P'}$$

$$\text{(Call)} \frac{P[z_1/x_1, \dots, z_n/x_n] \xrightarrow{\alpha} P' \quad (C(x_1, \dots, x_n) = P, z_i \text{ value of } e_i)}{C(e_1, \dots, e_n) \xrightarrow{\alpha} P'}$$

Semantics of Value-Passing CCS

Semantics of Value-Passing CCS II

Definition 8.4 (Semantics of value-passing CCS; continued)

$$\text{(Rel)} \frac{P \xrightarrow{\alpha} P'}{P[f] \xrightarrow{f(\alpha)} P'[f]}$$

$$\text{(Res)} \frac{P \xrightarrow{\alpha} P' \quad (\alpha \notin (L \cup \bar{L}) \times \mathbb{Z})}{P \setminus L \xrightarrow{\alpha} P' \setminus L}$$

$$\text{(If)} \frac{P \xrightarrow{\alpha} P' \quad (b \text{ true})}{\text{if } b \text{ then } P \xrightarrow{\alpha} P'}$$

$$\text{(Call)} \frac{P[z_1/x_1, \dots, z_n/x_n] \xrightarrow{\alpha} P' \quad (C(x_1, \dots, x_n) = P, z_i \text{ value of } e_i)}{C(e_1, \dots, e_n) \xrightarrow{\alpha} P'}$$

Remarks:

- $P[z_1/x_1, \dots, z_n/x_n]$ denotes the **substitution** of each free (i.e., unbound) occurrence of x_i by z_i ($1 \leq i \leq n$)
- **Relabelling** functions are extended to actions by letting

$$f(a(z)) := f(a)(z) \quad \text{and} \quad f(\bar{a}(z)) := \overline{f(a)}(z) \quad (\text{and } f(\tau) := \tau)$$

Semantics of Value-Passing CCS III

Further remarks:

- The binding restriction ensures that all integer and Boolean expressions have a **defined value**

Semantics of Value-Passing CCS III

Further remarks:

- The binding restriction ensures that all integer and Boolean expressions have a **defined value**
- The **two-armed conditional** $\text{if } b \text{ then } P \text{ else } Q$ can be defined by
$$(\text{if } b \text{ then } P) + (\text{if } \neg b \text{ then } Q)$$

Semantics of Value-Passing CCS

Semantics of Value-Passing CCS III

Further remarks:

- The binding restriction ensures that all integer and Boolean expressions have a **defined value**
- The **two-armed conditional** $\text{if } b \text{ then } P \text{ else } Q$ can be defined by
$$(\text{if } b \text{ then } P) + (\text{if } \neg b \text{ then } Q)$$

Example 8.5

One-place buffer that outputs non-negative predecessor of stored value:

$$B = \text{in}(x).B'(x)$$
$$B'(x) = (\text{if } x = 0 \text{ then } \overline{\text{out}}(0).B) + (\text{if } x > 0 \text{ then } \overline{\text{out}}(x - 1).B)$$

(on the board)

Translation of Value-Passing into Pure CCS

Outline of Lecture 8

Syntax of Value-Passing CCS

Semantics of Value-Passing CCS

Translation of Value-Passing into Pure CCS

Modelling Mobile Concurrent Systems

Another Example: Mobile Clients

Translation of Value-Passing into Pure CCS

Translation of Value-Passing into Pure CCS I

- **To show:** value-passing process definitions can be represented in pure CCS
- **Idea:** each parametrised construct ($a(x)$, $\bar{a}(e)$, $C(e_1, \dots, e_n)$) corresponds to a **family** of constructs in pure CCS, one for each possible integer value
- Requires extension of pure CCS by **infinite** choices (“ $\sum \dots$ ”), restrictions, and process definitions

Translation of Value-Passing into Pure CCS

Translation of Value-Passing into Pure CCS II

Definition 8.6 (Translation of value-passing into pure CCS)

For each $P \in Prc^+$ without free variables, its **translated form** $\widehat{P} \in Prc$ is given by

$$\begin{array}{ll} \widehat{\text{nil}} := \text{nil} & \widehat{\tau.P} := \tau.\widehat{P} \\ \widehat{a(x).P} := \sum_{z \in \mathbb{Z}} a_z.\widehat{P[z/x]} & \widehat{\bar{a}(e).P} := \bar{a}_z.\widehat{P} \quad (z \text{ value of } e) \\ \widehat{P_1 + P_2} := \widehat{P_1} + \widehat{P_2} & \widehat{P_1 \parallel P_2} := \widehat{P_1} \parallel \widehat{P_2} \\ \widehat{P \setminus L} := \widehat{P} \setminus \{a_z \mid a \in L, z \in \mathbb{Z}\} & \widehat{P[f]} := \widehat{P}[\widehat{f}] \quad (\widehat{f}(a_z) := f(a)_z) \\ \text{if } \widehat{b} \text{ then } \widehat{P} := \begin{cases} \widehat{P} & \text{if } b \text{ true} \\ \text{nil} & \text{otherwise} \end{cases} & \widehat{C(e_1, \dots, e_n)} := C_{z_1, \dots, z_n} \quad (z_i \text{ value of } e_i) \end{array}$$

Translation of Value-Passing into Pure CCS

Translation of Value-Passing into Pure CCS II

Definition 8.6 (Translation of value-passing into pure CCS)

For each $P \in Prc^+$ without free variables, its **translated form** $\widehat{P} \in Prc$ is given by

$$\begin{array}{ll} \widehat{nil} := nil & \widehat{\tau.P} := \tau.\widehat{P} \\ \widehat{a(x).P} := \sum_{z \in \mathbb{Z}} a_z.\widehat{P[z/x]} & \widehat{\bar{a}(e).P} := \bar{a}_z.\widehat{P} \quad (z \text{ value of } e) \\ \widehat{P_1 + P_2} := \widehat{P_1} + \widehat{P_2} & \widehat{P_1 \parallel P_2} := \widehat{P_1} \parallel \widehat{P_2} \\ \widehat{P \setminus L} := \widehat{P} \setminus \{a_z \mid a \in L, z \in \mathbb{Z}\} & \widehat{P[f]} := \widehat{P}[\widehat{f}] \quad (\widehat{f}(a_z) := f(a)_z) \\ \text{if } \widehat{b} \text{ then } \widehat{P} := \begin{cases} \widehat{P} & \text{if } b \text{ true} \\ nil & \text{otherwise} \end{cases} & \widehat{C(e_1, \dots, e_n)} := C_{z_1, \dots, z_n} \quad (z_i \text{ value of } e_i) \end{array}$$

Moreover, each defining equation $C(x_1, \dots, x_n) = P$ of a process identifier is translated into the indexed collection of process definitions

$$\left(C_{z_1, \dots, z_n} = P[z_1/x_1, \dots, z_n/x_n] \mid v_1, \dots, v_n \in \mathbb{Z} \right)$$

Translation of Value-Passing into Pure CCS

Translation of Value-Passing into Pure CCS III

Example 8.7 (cf. Example 8.5)

$$B = in(x).B'(x)$$

$$B'(x) = (\text{if } x = 0 \text{ then } \overline{out}(0).B) + (\text{if } x > 0 \text{ then } \overline{out}(x - 1).B)$$

(on the board)

Translation of Value-Passing into Pure CCS

Translation of Value-Passing into Pure CCS III

Example 8.7 (cf. Example 8.5)

$$B = in(x).B'(x)$$

$$B'(x) = (\text{if } x = 0 \text{ then } \overline{out}(0).B) + (\text{if } x > 0 \text{ then } \overline{out}(x - 1).B)$$

(on the board)

Theorem 8.8 (Correctness of translation)

For all $P, P' \in \text{Prc}^+$ and $\alpha \in \text{Act}$,

$$P \xrightarrow{\alpha} P' \iff \widehat{P} \xrightarrow{\widehat{\alpha}} \widehat{P}'$$

where $\widehat{a}(z) := a_z$, $\widehat{\bar{a}}(z) := \bar{a}_z$, and $\widehat{\tau} := \tau$.

Translation of Value-Passing into Pure CCS

Translation of Value-Passing into Pure CCS III

Example 8.7 (cf. Example 8.5)

$$B = in(x).B'(x)$$

$$B'(x) = (\text{if } x = 0 \text{ then } \overline{out}(0).B) + (\text{if } x > 0 \text{ then } \overline{out}(x - 1).B)$$

(on the board)

Theorem 8.8 (Correctness of translation)

For all $P, P' \in \text{Prc}^+$ and $\alpha \in \text{Act}$,

$$P \xrightarrow{\alpha} P' \iff \widehat{P} \xrightarrow{\widehat{\alpha}} \widehat{P}'$$

where $\widehat{a}(z) := a_z$, $\widehat{\bar{a}}(z) := \bar{a}_z$, and $\widehat{\tau} := \tau$.

Proof.

by induction on the structure of P (omitted) □

Modelling Mobile Concurrent Systems

Outline of Lecture 8

Syntax of Value-Passing CCS

Semantics of Value-Passing CCS

Translation of Value-Passing into Pure CCS

Modelling Mobile Concurrent Systems

Another Example: Mobile Clients

Mobility in Concurrent Systems I

Observation: CCS imposes a **static communication structure**: if $P, Q \in Proc$ want to communicate, then both must syntactically refer to the same action name

Mobility in Concurrent Systems I

Observation: CCS imposes a **static communication structure**: if $P, Q \in Proc$ want to communicate, then both must syntactically refer to the same action name

⇒ every potential communication partner known beforehand,
no dynamic passing of communication links

Mobility in Concurrent Systems I

Observation: CCS imposes a **static communication structure**: if $P, Q \in Proc$ want to communicate, then both must syntactically refer to the same action name

- ⇒ every potential communication partner known beforehand, no dynamic passing of communication links
- ⇒ lack of modelling capabilities for **mobility**

Mobility in Concurrent Systems I

Observation: CCS imposes a **static communication structure**: if $P, Q \in Proc$ want to communicate, then both must syntactically refer to the same action name

- ⇒ every potential communication partner known beforehand, no dynamic passing of communication links
- ⇒ lack of modelling capabilities for **mobility**

Goal: develop calculus in the spirit of CCS which supports mobility

- ⇒ π -Calculus

Mobility in Concurrent Systems II

Example 8.9 (Dynamic access to resources)

- Server S controls access to printer P
- Client C wishes to use P

Mobility in Concurrent Systems II

Example 8.9 (Dynamic access to resources)

- Server S controls access to printer P
- Client C wishes to use P
- In CCS: P and C must share some action name a
 - $\implies C$ could access P without being granted it by S

Mobility in Concurrent Systems II

Example 8.9 (Dynamic access to resources)

- Server S controls access to printer P
- Client C wishes to use P
- In CCS: P and C must share some action name a
 - $\implies C$ could access P without being granted it by S
- In π -Calculus:
 - initially only S has access to P (using link a)
 - using another link b , C can request access to P

Mobility in Concurrent Systems II

Example 8.9 (Dynamic access to resources)

- Server S controls access to printer P
- Client C wishes to use P
- In CCS: P and C must share some action name a
 $\implies C$ could access P without being granted it by S
- In π -Calculus:
 - initially only S has access to P (using link a)
 - using another link b , C can request access to P
- Formally:

$$\underbrace{\bar{b}\langle a \rangle . S'}_S \parallel \underbrace{b(c) . \bar{c}\langle d \rangle . C'}_C \parallel \underbrace{a(e) . P'}_P$$

- a : link to P
- b : link between S and C
- c : “placeholder” for a
- d : data to be printed
- e : “placeholder” for d

Mobility in Concurrent Systems II

Example 8.9 (Dynamic access to resources)

- Server S controls access to printer P
- Client C wishes to use P
- In CCS: P and C must share some action name a
 $\implies C$ could access P without being granted it by S
- In π -Calculus:
 - initially only S has access to P (using link a)
 - using another link b , C can request access to P
- Formally:

$$\begin{array}{c} \underbrace{\bar{b}\langle a \rangle . S'}_S \parallel \underbrace{b(c) . \bar{c}\langle d \rangle . C'}_C \parallel \underbrace{a(e) . P'}_P \\ \xrightarrow{\tau} S' \parallel \bar{a}\langle d \rangle . C' \parallel a(e) . P' \end{array}$$

- a : link to P
- b : link between S and C
- c : “placeholder” for a
- d : data to be printed
- e : “placeholder” for d

Mobility in Concurrent Systems II

Example 8.9 (Dynamic access to resources)

- Server S controls access to printer P
- Client C wishes to use P
- In CCS: P and C must share some action name a
 - ⇒ C could access P without being granted it by S
- In π -Calculus:
 - initially only S has access to P (using link a)
 - using another link b , C can request access to P
- Formally:

$$\begin{aligned} & \underbrace{\bar{b}\langle a \rangle . S'}_S \parallel \underbrace{b(c) . \bar{c}\langle d \rangle . C'}_C \parallel \underbrace{a(e) . P'}_P \\ \xrightarrow{\tau} & S' \parallel \bar{a}\langle d \rangle . C' \parallel a(e) . P' \\ \xrightarrow{\tau} & S' \parallel C' \parallel P'[d/e] \end{aligned}$$

- a : link to P
- b : link between S and C
- c : “placeholder” for a
- d : data to be printed
- e : “placeholder” for d

Mobility in Concurrent Systems III

Example 8.9 (Dynamic access to resources; continued)

- Different rôles of action name a :
 - in interaction between S and C : **object transferred** from S to C
 - in interaction between C and P : name of **communication link**

Mobility in Concurrent Systems III

Example 8.9 (Dynamic access to resources; continued)

- Different rôles of action name a :
 - in interaction between S and C : **object transferred** from S to C
 - in interaction between C and P : name of **communication link**
- Intuitively, names represent **access rights**:
 - a : for P
 - b : for S
 - d : for data to be printed

Mobility in Concurrent Systems III

Example 8.9 (Dynamic access to resources; continued)

- Different rôles of action name a :
 - in interaction between S and C : object transferred from S to C
 - in interaction between C and P : name of communication link
- Intuitively, names represent access rights:
 - a : for P
 - b : for S
 - d : for data to be printed
- If a is only way to access P
 $\implies P$ “moves” from S to C

Another Example: Mobile Clients

Outline of Lecture 8

Syntax of Value-Passing CCS

Semantics of Value-Passing CCS

Translation of Value-Passing into Pure CCS

Modelling Mobile Concurrent Systems

Another Example: Mobile Clients

Another Example: Mobile Clients

Mobile Clients I

Example 8.10 (Hand-over protocol)

Scenario:

- **client devices** moving around (phones, PCs, sensors, ...)
- each radio-connected to some **base station**
- stations wired to **central control**
- some event (e.g., signal fading) may cause a client to be **switched** to another station
- essential: specification of switching process (“**hand-over protocol**”)

Another Example: Mobile Clients

Mobile Clients I

Example 8.10 (Hand-over protocol)

Scenario:

- **client devices** moving around (phones, PCs, sensors, ...)
- each radio-connected to some **base station**
- stations wired to **central control**
- some event (e.g., signal fading) may cause a client to be **switched** to another station
- essential: specification of switching process (“**hand-over protocol**”)

Simplest case:

two stations, one client

Another Example: Mobile Clients

Mobile Clients II

Example 8.10 (Hand-over protocol; continued)

- Every station is in one of two **modes**: *Station* (active; four links) or *Idle* (inactive; two links)

Another Example: Mobile Clients

Mobile Clients II

Example 8.10 (Hand-over protocol; continued)

- Every station is in one of two **modes**: *Station* (active; four links) or *Idle* (inactive; two links)
- *Client* can **talk** via *Station*, and at any time *Control* can request *Station/Idle* to **lose/gain** *Client*:

$$\begin{aligned} \text{Station}(\text{talk}, \text{switch}, \text{gain}, \text{lose}) &= \text{talk}.\text{Station}(\text{talk}, \text{switch}, \text{gain}, \text{lose}) + \\ &\quad \text{lose}(t, s).\overline{\text{switch}}\langle t, s \rangle.\text{Idle}(\text{gain}, \text{lose}) \\ \text{Idle}(\text{gain}, \text{lose}) &= \text{gain}(t, s).\text{Station}(t, s, \text{gain}, \text{lose}) \end{aligned}$$

Another Example: Mobile Clients

Mobile Clients II

Example 8.10 (Hand-over protocol; continued)

- Every station is in one of two **modes**: *Station* (active; four links) or *Idle* (inactive; two links)
- *Client* can **talk** via *Station*, and at any time *Control* can request *Station/Idle* to **lose/gain** *Client*:

$$\text{Station}(\text{talk}, \text{switch}, \text{gain}, \text{lose}) = \text{talk}.\text{Station}(\text{talk}, \text{switch}, \text{gain}, \text{lose}) + \text{lose}(t, s).\overline{\text{switch}}\langle t, s \rangle.\text{Idle}(\text{gain}, \text{lose})$$

$$\text{Idle}(\text{gain}, \text{lose}) = \text{gain}(t, s).\text{Station}(t, s, \text{gain}, \text{lose})$$

- If *Control* decides *Station* to lose *Client*, it issues a **new pair of channels** to be shared by *Client* and *Idle*:

$$\text{Control}_1 = \overline{\text{lose}}_1\langle \text{talk}_2, \text{switch}_2 \rangle.\overline{\text{gain}}_2\langle \text{talk}_2, \text{switch}_2 \rangle.\text{Control}_2$$

$$\text{Control}_2 = \overline{\text{lose}}_2\langle \text{talk}_1, \text{switch}_1 \rangle.\overline{\text{gain}}_1\langle \text{talk}_1, \text{switch}_1 \rangle.\text{Control}_1$$

Another Example: Mobile Clients

Mobile Clients II

Example 8.10 (Hand-over protocol; continued)

- Every station is in one of two **modes**: *Station* (active; four links) or *Idle* (inactive; two links)
- *Client* can **talk** via *Station*, and at any time *Control* can request *Station/Idle* to **lose/gain** *Client*:

$$\begin{aligned} \text{Station}(\text{talk}, \text{switch}, \text{gain}, \text{lose}) &= \text{talk}.\text{Station}(\text{talk}, \text{switch}, \text{gain}, \text{lose}) + \\ &\quad \text{lose}(t, s).\overline{\text{switch}}\langle t, s \rangle.\text{Idle}(\text{gain}, \text{lose}) \\ \text{Idle}(\text{gain}, \text{lose}) &= \text{gain}(t, s).\text{Station}(t, s, \text{gain}, \text{lose}) \end{aligned}$$

- If *Control* decides *Station* to lose *Client*, it issues a **new pair of channels** to be shared by *Client* and *Idle*:

$$\begin{aligned} \text{Control}_1 &= \overline{\text{lose}}_1\langle \text{talk}_2, \text{switch}_2 \rangle.\overline{\text{gain}}_2\langle \text{talk}_2, \text{switch}_2 \rangle.\text{Control}_2 \\ \text{Control}_2 &= \overline{\text{lose}}_2\langle \text{talk}_1, \text{switch}_1 \rangle.\overline{\text{gain}}_1\langle \text{talk}_1, \text{switch}_1 \rangle.\text{Control}_1 \end{aligned}$$

- *Client* can either **talk** or, if requested, **switch** to a new pair of channels:

$$\text{Client}(\text{talk}, \text{switch}) = \overline{\text{talk}}.\text{Client}(\text{talk}, \text{switch}) + \text{switch}(t, s).\text{Client}(t, s)$$

Another Example: Mobile Clients

Mobile Clients III

Example 8.10 (Hand-over protocol; continued)

- As usual, the whole system is a **restricted composition** of processes:

$$System_1 = new L (Client_1 \parallel Station_1 \parallel Idle_2 \parallel Control_1)$$

where

$$\begin{aligned} Client_i &:= Client(talk_i, switch_i) \\ Station_i &:= Station(talk_i, switch_i, gain_i, lose_i) \\ Idle_i &:= Idle(gain_i, lose_i) \\ L &:= (talk_i, switch_i, gain_i, lose_i \mid i \in \{1, 2\}) \end{aligned}$$

Another Example: Mobile Clients

Mobile Clients III

Example 8.10 (Hand-over protocol; continued)

- As usual, the whole system is a **restricted composition** of processes:

$$System_1 = \text{new } L (Client_1 \parallel Station_1 \parallel Idle_2 \parallel Control_1)$$

where

$$Client_i := Client(talk_i, switch_i)$$

$$Station_i := Station(talk_i, switch_i, gain_i, lose_i)$$

$$Idle_i := Idle(gain_i, lose_i)$$

$$L := (talk_i, switch_i, gain_i, lose_i \mid i \in \{1, 2\})$$

- After having formally defined the π -Calculus we will see that this protocol is **correct**, i.e., that the hand-over does indeed occur:

$$System_1 \longrightarrow^* System_2$$

where

$$System_2 = \text{new } L (Client_2 \parallel Idle_1 \parallel Station_2 \parallel Control_2)$$
