Syntax of the Monadic π-Calculus

Definition (Syntax of monadic π-Calculus)

- Let $A = \{a, b, c \ldots, x, y, z, \ldots\}$ be a set of names.
- The set of action prefixes is given by

$$\begin{array}{lll} \pi ::= & x(y) & \text{(receive } y \text{ along } x\text{)} \\ \mid & \overline{x}\langle y \rangle & \text{(send } y \text{ along } x\text{)} \\ \mid & \tau & \text{(unobservable action)} \end{array}$$

- The set Prc^{π} of π-Calculus process expressions is defined by the following syntax:

$$\begin{array}{lll} P ::= & \sum_{i \in I} \pi_i . P_i & \text{(guarded sum)} \\ \mid & P_1 \parallel P_2 & \text{(parallel composition)} \\ \mid & \text{new } x\ P & \text{(restriction)} \\ \mid & !P & \text{(replication)} \end{array}$$

(where I finite index set, $x \in A$)

Conventions: $\text{nil} := \sum_{i \in \emptyset} \pi_i . P_i$, $\text{new } x_1, \ldots, x_n\ P := \text{new } x_1 \left(\ldots \text{new } x_n\ P \right)$

Recap: The Monadic π-Calculus

Structural Congruence

Goal: simplify definition of operational semantics by ignoring "purely syntactic" differences between processes

Definition (Structural congruence)

$P, Q \in Prc^{\pi}$ are structurally congruent, written $P \equiv Q$, if one can be transformed into the other by applying the following operations and equations:

1. renaming of bound names (α-conversion)
2. reordering of terms in a summation (commutativity of $+$)
3. $P \parallel Q \equiv Q \parallel P$, $P \parallel (Q \parallel R) \equiv (P \parallel Q) \parallel R$, $P \parallel \text{nil} \equiv P$ (Abelian monoid laws for $\parallel$)
4. $\text{new}\, x\, \text{nil} \equiv \text{nil}$, $\text{new}\, x, y\, P \equiv \text{new}\, y, x\, P$,
   $P \parallel \text{new}\, x\, Q \equiv \text{new}\, x\, (P \parallel Q)$ if $x \notin fn(P)$ (scope extension)
5. $!P \equiv P \parallel !P$ (unfolding)

A Standard Form

Theorem (Standard form)

Every process expression is structurally congruent to a process of the standard form

$$\text{new } x_1, \ldots, x_k \, (P_1 \parallel \ldots \parallel P_m \parallel !Q_1 \parallel \ldots \parallel !Q_n)$$

where each P_i is a non-empty guarded sum, and each Q_j is in standard form.

(If $m = n = 0$: nil; if $k = 0$: restriction absent)

Proof.

by induction on the structure of $R \in Prc^{\pi}$ (on the board) □

The Reaction Relation

Thanks to Theorem 8.7, only processes in standard form need to be considered for defining the operational semantics:

Definition

The reaction relation $\longrightarrow \subseteq Prc^{\pi} \times Prc^{\pi}$ is generated by the rules:

$$\text{(Tau)}\ \frac{}{\tau.P + Q \longrightarrow P}$$

$$\text{(React)}\ \frac{}{(x(y).P + R) \parallel (\overline{x}\langle z\rangle.Q + S) \longrightarrow P[z/y] \parallel Q}$$

$$\text{(Par)}\ \frac{P \longrightarrow P'}{P \parallel Q \longrightarrow P' \parallel Q} \qquad \text{(Res)}\ \frac{P \to P'}{\text{new } x\ P \longrightarrow \text{new } x\ P'}$$

$$\text{(Struct)}\ \frac{P \longrightarrow P'}{Q \longrightarrow Q'} \quad \text{if } P \equiv Q \text{ and } P' \equiv Q'$$

- $P[z/y]$ replaces every free occurrence of y in P by z.
- In (React), the pair $(x(y), \overline{x}\langle z\rangle)$ is called a redex.

Example Reactions

The Printer Server Revisited

Example 9.1

1. Printer server (cf. Example 8.1):

$$\underbrace{\overline{b}\langle a\rangle.S'}_{S} \parallel \underbrace{a(e).P'}_{P} \parallel \underbrace{b(c).\overline{c}\langle d\rangle.C'}_{C} \longrightarrow S' \parallel P \parallel \overline{a}\langle d\rangle.C'[a/c]$$

$$S' \parallel P \parallel \overline{a}\langle d\rangle.C'[a/c] \longrightarrow S' \parallel P'[d/e] \parallel C'[a/c]$$

(on the board)

Example Reactions

The Printer Server Revisited

Example 9.1

1. Printer server (cf. Example 8.1):

$$\underbrace{\overline{b}\langle a\rangle.S'}_{S} \parallel \underbrace{a(e).P'}_{P} \parallel \underbrace{b(c).\overline{c}\langle d\rangle.C'}_{C} \longrightarrow S' \parallel P \parallel \overline{a}\langle d\rangle.C'[a/c]$$

$$S' \parallel P \parallel \overline{a}\langle d\rangle.C'[a/c] \longrightarrow S' \parallel P'[d/e] \parallel C'[a/c]$$

   (on the board)

2. With scope extension ($P \parallel \text{new}\, x\, Q \equiv \text{new}\, x\, (P \parallel Q)$ if $x \notin fn(P)$):

$$\begin{aligned} &\text{new}\, b\, (\text{new}\, a\, (\overline{b}\langle a\rangle.S' \parallel a(e).P') \parallel b(c).\overline{c}\langle d\rangle.C') \\ \longrightarrow\ &\text{new}\, a, b\, (S' \parallel a(e).P' \parallel \overline{a}\langle d\rangle.C'[a/c]) \end{aligned}$$

   (on the board)

Mobile Clients Revisited

Example 9.2

- System specification (cf. Example 8.2):

$$
\begin{aligned}
System_1 &= \text{new } L\,(Client_1 \parallel Station_1 \parallel Idle_2 \parallel Control_1)\\
System_2 &= \text{new } L\,(Client_2 \parallel Idle_1 \parallel Station_2 \parallel Control_2)\\
Station(talk, switch, gain, lose) &= talk.Station(talk, switch, gain, lose) +\\
&\quad\ lose(t, s).\overline{switch}\langle t, s\rangle.Idle(gain, lose)\\
Idle(gain, lose) &= gain(t, s).Station(t, s, gain, lose)\\
Control_1 &= \overline{lose_1}\langle talk_2, switch_2\rangle.\overline{gain_2}\langle talk_2, switch_2\rangle.Control_2\\

Outline of Lecture 9

Recursive Process Calls I

- **So far:** process replication $!P$
- **Now:** parametric process definitions of the form

$$A(x_1, \ldots, x_n) = P_A$$

where A is a process identifier and P_A a process expression containing calls of A (and possibly other parametric processes)

Recursive Process Calls I

- **So far:** process replication $!P$
- **Now:** parametric process definitions of the form

$$A(x_1, \ldots, x_n) = P_A$$

  where A is a process identifier and P_A a process expression containing calls of A (and possibly other parametric processes)
- Semantic interpretation by new congruence rule:

$$A(y_1, \ldots, y_n) \equiv P_A[y_1/x_1, \ldots, y_n/x_n]$$

- Semantic interpretation by new congruence rule:

$$A(y_1, \ldots, y_n) \equiv P_A[y_1/x_1, \ldots, y_n/x_n]$$

- Again: possible to simulate in basic calculus by using
  - message passing to model parameter passing to A
  - replication to model the multiple activations of A
  - restriction to model the scope of the definition of A

Recursive Process Calls II

The encoding

- of a process definition $A(\vec{x}) = P_A$
- with right-hand side $P_A = \ldots A(\vec{u}) \ldots A(\vec{v}) \ldots$
- for main process $Q = \ldots A(\vec{y}) \ldots A(\vec{z}) \ldots$

is defined as follows:
