# Recap: Axiomatic Semantics of WHILE

---

## Partial Correctness Properties

### Validity of partial correctness property

$\{A\} c \{B\}$  is **valid** iff for all states  $\sigma \in \Sigma$  which satisfy  $A$ :  
if the execution of  $c$  in  $\sigma$  terminates in  $\sigma' \in \Sigma$ , then  $\sigma'$  satisfies  $B$ .

# Recap: Axiomatic Semantics of WHILE

## Syntax of Assertion Language

### Definition (Syntax of assertions)

The **syntax of *Assn*** is defined by the following context-free grammar:

$$\begin{aligned} a &::= z \mid x \mid i \mid a_1 + a_2 \mid a_1 - a_2 \mid a_1 * a_2 \in LExp \\ A &::= t \mid a_1 = a_2 \mid a_1 > a_2 \mid \neg A \mid A_1 \wedge A_2 \mid A_1 \vee A_2 \mid \forall i. A \in Assn \end{aligned}$$

- Thus:  $AExp \subsetneq LExp$ ,  $BExp \subsetneq Assn$
- The following (and other) **abbreviations** will be employed:

$$\begin{aligned} A_1 \Rightarrow A_2 &:= \neg A_1 \vee A_2 \\ \exists i. A &:= \neg(\forall i. \neg A) \\ a_1 \geq a_2 &:= a_1 > a_2 \vee a_1 = a_2 \\ &\vdots \end{aligned}$$

# Recap: Axiomatic Semantics of WHILE

## Semantics of $LExp$

The semantics now additionally depends on values of logical variables:

### Definition (Semantics of $LExp$ )

An **interpretation** is an element of the set  $Int := \{I \mid I : LVar \rightarrow \mathbb{Z}\}$ . The **value of an arithmetic expressions with logical variables** is given by the functional

$$\mathcal{L}[\cdot] : LExp \rightarrow (Int \rightarrow (\Sigma \rightarrow \mathbb{Z}))$$

where

$$\begin{array}{ll} \mathcal{L}[z] l\sigma := z & \mathcal{L}[a_1 + a_2] l\sigma := \mathcal{L}[a_1] l\sigma + \mathcal{L}[a_2] l\sigma \\ \mathcal{L}[x] l\sigma := \sigma(x) & \mathcal{L}[a_1 - a_2] l\sigma := \mathcal{L}[a_1] l\sigma - \mathcal{L}[a_2] l\sigma \\ \mathcal{L}[i] l\sigma := I(i) & \mathcal{L}[a_1 * a_2] l\sigma := \mathcal{L}[a_1] l\sigma \cdot \mathcal{L}[a_2] l\sigma \end{array}$$

Definition 6.1 (denotational semantics of arithmetic expressions) implies:

### Corollary

For every  $a \in AExp$  (without logical variables),  $I \in Int$ , and  $\sigma \in \Sigma$ :

$$\mathcal{L}[a] l\sigma = \mathcal{U}[a]\sigma.$$

# Recap: Axiomatic Semantics of WHILE

## Semantics of Assertions

**Reminder:**  $A ::= t \mid a_1 = a_2 \mid a_1 > a_2 \mid \neg A \mid A_1 \wedge A_2 \mid A_1 \vee A_2 \mid \forall i. A \in Assn$

### Definition (Semantics of assertions)

Let  $A \in Assn$ ,  $\sigma \in \Sigma_{\perp}$ , and  $I \in Int$ . The relation “ $\sigma$  satisfies  $A$  in  $I$ ” (notation:  $\sigma \models^I A$ ) is inductively defined by:

$$\begin{aligned} \sigma &\models^I \text{true} \\ \sigma &\models^I a_1 = a_2 && \text{if } \mathcal{L}[a_1]I\sigma = \mathcal{L}[a_2]I\sigma \\ \sigma &\models^I a_1 > a_2 && \text{if } \mathcal{L}[a_1]I\sigma > \mathcal{L}[a_2]I\sigma \\ \sigma &\models^I \neg A && \text{if not } \sigma \models^I A \\ \sigma &\models^I A_1 \wedge A_2 && \text{if } \sigma \models^I A_1 \text{ and } \sigma \models^I A_2 \\ \sigma &\models^I A_1 \vee A_2 && \text{if } \sigma \models^I A_1 \text{ or } \sigma \models^I A_2 \\ \sigma &\models^I \forall i. A && \text{if } \sigma \models^{[i \rightarrow z]} A \text{ for every } z \in \mathbb{Z} \\ \perp &\models^I A \end{aligned}$$

Furthermore  $\sigma$  satisfies  $A$  ( $\sigma \models A$ ) if  $\sigma \models^I A$  for every interpretation  $I \in Int$ , and  $A$  is called **valid** ( $\models A$ ) if  $\sigma \models A$  for every state  $\sigma \in \Sigma$ .

# Recap: Axiomatic Semantics of WHILE

## Partial Correctness Properties

### Definition (Partial correctness properties)

Let  $A, B \in Assn$  and  $c \in Cmd$ .

- An expression of the form  $\{A\} c \{B\}$  is called a **partial correctness property** with **precondition**  $A$  and **postcondition**  $B$ .
- Given  $\sigma \in \Sigma_{\perp}$  and  $I \in Int$ , we let

$$\sigma \models' \{A\} c \{B\}$$

if  $\sigma \models' A$  implies  $\mathcal{C}[[c]]\sigma \models' B$  (or equivalently:  $\sigma \in A' \Rightarrow \mathcal{C}[[c]]\sigma \in B'$ ).

- $\{A\} c \{B\}$  is called **valid in**  $I$  (notation:  $\models' \{A\} c \{B\}$ ) if  $\sigma \models' \{A\} c \{B\}$  for every  $\sigma \in \Sigma_{\perp}$  (or equivalently:  $\mathcal{C}[[c]]A' \subseteq B'$ ).
- $\{A\} c \{B\}$  is called **valid** (notation:  $\models \{A\} c \{B\}$ ) if  $\models' \{A\} c \{B\}$  for every  $I \in Int$ .

# Recap: Axiomatic Semantics of WHILE

## Hoare Logic

**Goal:** syntactic derivation of valid partial correctness properties.  
Here  $A[x \mapsto a]$  denotes the syntactic replacement of every occurrence of  $x$  by  $a$  in  $A$ .

Tony Hoare (\* 1934)

### Definition (Hoare Logic)

The **Hoare rules** are given by

$$\begin{array}{c} \text{(skip)} \frac{}{\{A\} \text{ skip } \{A\}} \\ \text{(seq)} \frac{\{A\} c_1 \{C\} \quad \{C\} c_2 \{B\}}{\{A\} c_1 ; c_2 \{B\}} \\ \text{(while)} \frac{\{A \wedge b\} c \{A\}}{\{A\} \text{ while } b \text{ do } c \text{ end } \{A \wedge \neg b\}} \\ \text{(asgn)} \frac{}{\{A[x \mapsto a]\} x := a \{A\}} \\ \text{(if)} \frac{\{A \wedge b\} c_1 \{B\} \quad \{A \wedge \neg b\} c_2 \{B\}}{\{A\} \text{ if } b \text{ then } c_1 \text{ else } c_2 \text{ end } \{B\}} \\ \text{(cons)} \frac{\models (A \Rightarrow A') \quad \{A'\} c \{B'\} \quad \models (B' \Rightarrow B)}{\{A\} c \{B\}} \end{array}$$

A partial correctness property is **provable** (notation:  $\vdash \{A\} c \{B\}$ ) if it is derivable by the Hoare rules. In (while),  $A$  is called a **(loop) invariant**.

# Soundness of Hoare Logic

---

## Soundness of Hoare Logic I

**Soundness:** **no wrong propositions** can be derived, i.e., every (syntactically) provable partial correctness property is also (semantically) valid

For the corresponding proof we use:

### Lemma 10.1 (Substitution lemma)

For every  $A \in Assn$ ,  $x \in Var$ ,  $a \in AExp$ ,  $\sigma \in \Sigma$ , and  $I \in Int$ :

$$\sigma \models' A[x \mapsto a] \iff \sigma[x \mapsto \mathcal{A}[[a]]\sigma] \models' A.$$

Proof.

by induction over  $A \in Assn$  (omitted) □

# Soundness of Hoare Logic

---

## Soundness of Hoare Logic II

### Theorem 10.2 (Soundness of Hoare Logic)

For every partial correctness property  $\{A\} c \{B\}$ ,

$$\vdash \{A\} c \{B\} \quad \Rightarrow \quad \models \{A\} c \{B\}.$$

### Proof.

Let  $\vdash \{A\} c \{B\}$ . By induction over the structure of the corresponding proof tree we show that, for every  $\sigma \in \Sigma$  and  $I \in \text{Int}$  such that  $\sigma \models' A$ ,  $\mathcal{C}[[c]]\sigma \models' B$  (on the board). (If  $\sigma = \perp$ , then  $\mathcal{C}[[c]]\sigma = \perp \models' B$  holds trivially.) □

# (In-)Completeness of Hoare Logic

## Incompleteness of Hoare Logic I

**Soundness:** only valid partial correctness properties are provable ✓

**Completeness:** all valid partial correctness properties are systematically derivable ⚡

### Theorem 10.3 (Gödel's Incompleteness Theorem)

*The set of all valid assertions*

$$\{A \in Assn \mid \models A\}$$

*is not recursively enumerable, i.e., there exists no proof system for  $Assn$  in which all valid assertions are systematically derivable.*

**Proof.**

see [Winskel 1996, p. 110 ff] □

Kurt Gödel  
(1906–1978)

# (In-)Completeness of Hoare Logic

---

## Incompleteness of Hoare Logic II

### Corollary 10.4

*There is no proof system in which all valid partial correctness properties can be enumerated.*

### Proof.

Given  $A \in \text{Assn}$ ,  $\models A$  is obviously equivalent to  $\{\text{true}\} \text{skip} \{A\}$ . Thus the enumerability of all valid partial correctness properties would imply the enumerability of all valid assertions. □

**Remark:** alternative proof (using computability theory):

$\{\text{true}\} c \{\text{false}\}$  is valid iff  $c$  does not terminate on any input state. But the set of all non-terminating WHILE statements is not enumerable.

# Relative Completeness of Hoare Logic

---

## Relative Completeness of Hoare Logic I

- We will see: actual reason of incompleteness is rule

$$\text{(cons)} \frac{\models (A \Rightarrow A') \quad \{A'\} c \{B'\} \quad \models (B' \Rightarrow B)}{\{A\} c \{B\}}$$

since it is based on the **validity of implications** within *Assn*

- The other language constructs are “enumerable”
  - Therefore: **separation** of proof system (Hoare Logic) and assertion language (*Assn*)
  - One can show: if an “oracle” is available which decides whether a given assertion is valid, then all valid partial correctness properties can be systematically derived
- ⇒ **“Relative completeness”**

# Relative Completeness of Hoare Logic

## Relative Completeness of Hoare Logic II

### Theorem 10.5 (Cook's Completeness Theorem)

Hoare Logic is *relatively complete*, i.e., for every partial correctness property  $\{A\} c \{B\}$ :

$$\models \{A\} c \{B\} \Rightarrow \vdash \{A\} c \{B\}.$$

Stephen A. Cook (\* 1939)

Thus: if we know that a partial correctness property is valid, then we know that there is a corresponding derivation.

The proof uses the following concept: assume that, e.g.,  $\{A\} c_1 ; c_2 \{B\}$  has to be derived. This requires an *intermediate assertion*  $C \in \text{Assn}$  such that  $\{A\} c_1 \{C\}$  and  $\{C\} c_2 \{B\}$ . How to find it?

# Relative Completeness of Hoare Logic

## Weakest Preconditions I

### Definition 10.6 (Weakest precondition)

Given  $c \in \text{Cmd}$ ,  $B \in \text{Assn}$  and  $I \in \text{Int}$ , the **weakest (liberal) precondition** of  $B$  with respect to  $c$  under  $I$  is defined by:

$$wp^I[[c, B]] := \{\sigma \in \Sigma_{\perp} \mid \mathcal{C}[[c]]\sigma \models^I B\}.$$

### Corollary 10.7

For every  $c \in \text{Cmd}$ ,  $A, B \in \text{Assn}$ , and  $I \in \text{Int}$ :

1.  $\models^I \{A\} c \{B\} \iff A^I \subseteq wp^I[[c, B]]$
2. If  $A_0 \in \text{Assn}$  such that  $A_0^I = wp^I[[c, B]]$  for every  $I \in \text{Int}$ , then

$$\models \{A\} c \{B\} \iff \models (A \Rightarrow A_0)$$

**Remark:** (2) justifies the notion of **weakest** precondition: it is implied by every precondition  $A$  that makes  $\{A\} c \{B\}$  valid

# Relative Completeness of Hoare Logic

## Weakest Preconditions II

### Definition 10.8 (Expressivity of assertion languages)

An assertion language  $Assn$  is called **expressive** if, for every  $c \in Cmd$  and  $B \in Assn$ , there exists  $A_{c,B} \in Assn$  such that  $A'_{c,B} = wp'[c, B]$  for every  $I \in Int$ .

### Theorem 10.9 (Expressivity of $Assn$ )

$Assn$  is expressive.

### Proof.

(idea; see [Winskel 1996, p. 103 ff for details])

Given  $c \in Cmd$  and  $B \in Assn$ , construct  $A_{c,B} \in Assn$  with

$\sigma \models' A_{c,B} \iff \mathcal{C}[c]\sigma \models' B$  (for every  $\sigma \in \Sigma_{\perp}$ ,  $I \in Int$ ). For example:

$$\begin{aligned} A_{\text{skip}, B} &:= B & A_{x:=a, B} &:= B[x \mapsto a] \\ A_{c_1; c_2, B} &:= A_{c_1, A_{c_2, B}} & & \dots \end{aligned}$$

(for **while**: “Gödelization” of sequences of intermediate states) □

# Relative Completeness of Hoare Logic

## Relative Completeness of Hoare Logic III

The following lemma shows that weakest preconditions are “provable”:

### Lemma 10.10

For every  $c \in \text{Cmd}$  and  $B \in \text{Assn}$ :  $\vdash \{A_{c,B}\} c \{B\}$

Proof.

by structural induction over  $c$  (omitted) □

Proof (Cook’s Completeness Theorem 10.5).

We have to show that Hoare Logic is relatively complete, i.e., that

$$\models \{A\} c \{B\} \Rightarrow \vdash \{A\} c \{B\}.$$

- Lemma 10.10:  $\vdash \{A_{c,B}\} c \{B\}$
- Corollary 10.7:  $\models \{A\} c \{B\} \Rightarrow \models (A \Rightarrow A_{c,B})$
- $\frac{\models (A \Rightarrow A_{c,B}) \quad \vdash \{A_{c,B}\} c \{B\} \quad \models (B \Rightarrow B)}{\vdash \{A\} c \{B\}}$  (cons) □
